## Explanation

## DESIGN COMPARISON TABLE

LOA: Length overall - overall length of boat.
BOA: Beam overall - overall width of boat.
DRAFT: Measured from waterline to lowest hull point.
DWL-DESIGN WATERLINE: The waterline drawn on the plans and transferred to the hulls, sitting at this waterline the boat will displace the calculated weight of the boat.

DISPLACEMENT: The weight of the boat when floating at the Designed Waterline DWL point (see above) (ie total loaded boat.)

DRY WEIGHT: The weight of the completed boat without Payload which is fuel, water, stores or personal gear, so as built with all fixtures.

BRUCE NO\POWER TO WEIGHT RATIO: This shows us the relationship between sail area and weight in a comparable figure (ie, how well she will sail). The higher the figure, the better. The "Light" figures shown in the design comparison table are for normal Coastal cruising load, "Heavy" is for fully stocked ocean cruising. (FORMULA = Cube root of displacement in Pounds, divided into the square root of the total sail area in feet) (Sail Area, we use main and genoa)

BRIDGEDECK CLEARANCE: Is the distance between the water and lowest point of the underwing. Important seaworthiness factor.

WATERLINE BEAM TO LENGTH RATIO: Shows the relationship between the length and width of one hull at Waterline. The higher the figure the more efficient the boat is.

WETTED AREA: Is the total under water area for both hulls and indicates parasitic drag. The more area in the water the more there is to drag through it.

ESTIMATED BUILDING HOURS AND MATERIALS COSTS: These are our estimates for a complete boat without spinnaker, radar, water makers etc.
Personal choices in building, finishing and equipment can affect these greatly and these estimates do not include tools, rent, electricity etc. We base these on feedback from customers and try to be as accurate as we can but obviously this is a very variable thing. We used to estimate a very low budget option to show what it "could" be built for but realise that most people now want a well finished cat so these estimates are an average of what the boats are being built and launched for MATERIAL COST ONLY. The new designs we base on similar volume boats. Do your own research - use these as a general guide only.

PAYLOAD: This is roughly how much personal gear, extra equipment, stores, water, fuel etc. the boat will carry before sitting on DWL. Found by subtracting the as built, dry weight from the displacement figure.

DRY WEIGHT: Subtract the Payload from the Displacement, and is what the weight of the boat should be, as built, not loaded. This is not always achieved and so the Payload is reduced - care and consideration must be given to this fact.

DIESELS: We understand that diesel engines are a popular choice for many people, they are therefore an option on those designs that can carry the extra weight. Shown in design comparison table.

CONSTRUCTION MATERIAL OPTIONS: See section in Table: $\mathbf{W}=$ Western Red Cedar Strip;
$\overline{\mathbf{D}}=$ Durakore strip; $\mathbf{D P}=$ Duflex Panels; $\mathbf{F}=$ Foam which could be straight Foam or Duflex Foam depending on design.
